Topical Review

High Temperature Superconductors for Commercial Magnets

Arno Godeke

Independent Consultant, 7557 XG Hengelo, The Netherlands

E-mail: agodeke@icloud.com

29 May 2022

Abstract. The steadily increasing magnetic fields that can be generated with superconducting magnets are reaching the limits of what is achievable with low- T_c what is currently available, and what is missing, is therefore considered timely and appropriate in this context.

Keywords: high temperature superconductor, magnet, Bi-2223, Bi-2212, REBCO

Submitted to: *Supercond. Sci. Technol.*

→
(In progress)

Agenda

■ Low Temperature Superconductors

- Why higher temperatures are cooler

■ High Temperature Superconductors

- Types, production, main properties, price

■ Applications

- Magnets, rotating machines, energy,...

■ An outlook for HTS

Low Temperature Superconductors

Present performance boundaries

Lee, in "100 years of Superconductivity" (2011) Godeke, Cryogenics 48, 308 (2008)

■ Magnetic field and temperature

■ Current density

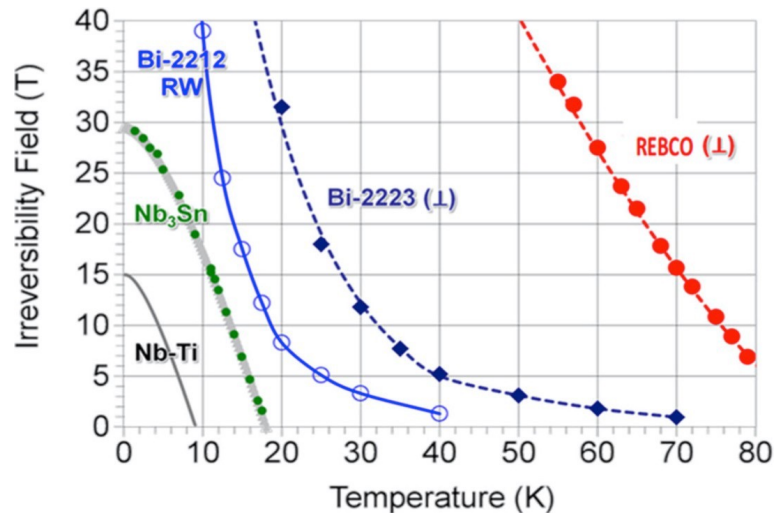

Nb-Ti → Fully optimized
 Nb₃Sn → Further potential (upcoming topical review)

Godeke, *J. Appl. Phys.* 97, 093909 (2005)
 Godeke, *IEEE Trans. Appl. Supercond.* 17, 1149 (2007)
 Arno Godeke – High Temperature Superconductors and Their Applications
 Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

Why higher temperatures are cooler (1)

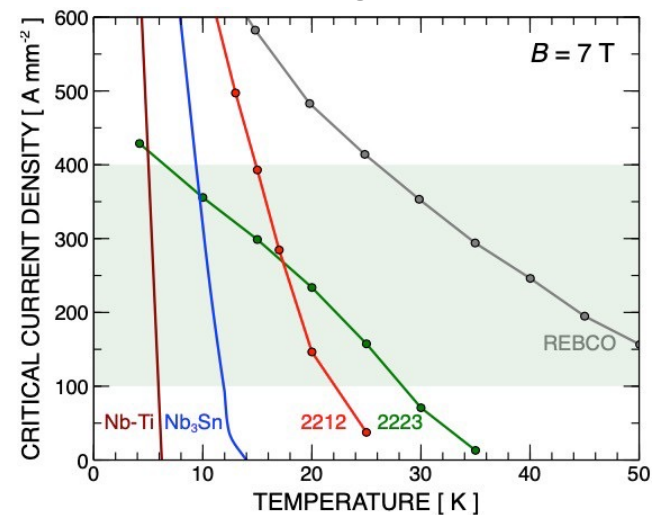

Increased performance boundaries with HTS

■ Higher magnetic fields are accessible

■ Usable at higher temperatures

- Helium is becoming scarce

Larbalestier, *Nat. Mat.* 13, 375 (2014)
Godeke, *Supercond. Sci. Technol.* 33, 064001 (2020)

Arno Godeke – High Temperature Superconductors and Their Applications
Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

Gains in magnetic field and operating temperature

Why higher temperatures are cooler (2)

Magnet operation becomes easier

QUENCH BEHAVIOR OF HTS MAGNETS

Comparing LTS (4K) to HTS (20K) operation

- HTS material: quench – resilient, lots of safety margin
- Benign behavior (properties) at higher temperature

HTS magnets are much more stable to operate

Lower n-values in HTS

- LTS → “Quench”
- HTS → Slow runaway

Upcoming Topical Review

Agenda

■ Low Temperature Superconductors

- Why higher temperatures are cooler

■ High Temperature Superconductors

- Types, production, main properties, price

■ Applications

- Magnets, rotating machines, energy,...

■ An outlook for HTS

High Temperature Superconductors

Three commercially available options

- Bi-2223 ($[\text{Bi-Pb}]_2\text{Sr}_2\text{Ca}_2\text{Cu}_3\text{O}_x$)
 - 1 (?) manufacturer
 - 4.2 or 4.5 mm wide, 0.23...0.35 mm thick tapes
 - Ag/Ag-alloy matrix with optional reinforcement
 - Multifilamentary, untwisted
 - Pre-reacted
- Bi-2212 ($\text{Bi}_2\text{Sr}_2\text{Ca}_1\text{Cu}_2\text{O}_x$)
 - 2+ (?) manufacturers
 - Round and rectangular wires of various dimensions
 - Ag/Ag-alloy matrix with optional reinforcement
 - Multifilamentary, twisted or untwisted
 - Wind & React or pre-reacted
- REBCO ($[\text{RE}]\text{Ba}_2\text{Cu}_3\text{O}_x$)
 - 10+ (?) manufacturers
 - 2...40 mm wide, about 0.05...0.2 mm thick tapes
 - High-strength substrate with variable Cu plating
 - Single- or double REBCO layer
 - Pre-reacted

Uglietti, *Supercond. Sci. Technol.* 32, 053001 (2019)

Arno Godeke – High Temperature Superconductors and Their Applications
Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

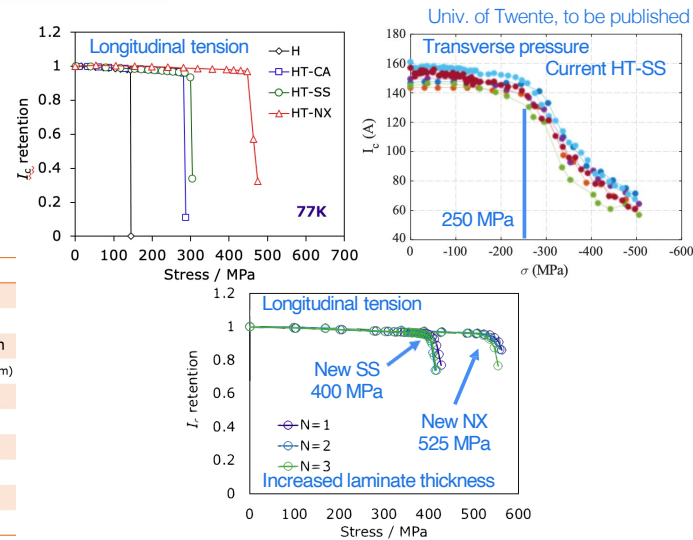

Bi-2223 conductors

Type
 H & G
 HT-SS
 HT-CA
 HT-NX

Specifications	Type H	Type G
Average Width	4.2 ± 0.2 mm	4.2 ± 0.2 mm
Average Thickness	0.23 ± 0.01 mm	0.23 ± 0.01 mm
Length / Matrix	Up to 1000 m	Ag-Au 5.4wt%
I_c (77 K, Self Field)	≥ 170 A	≥ 170 A
Critical Wire Tension* (RT)	80 N **	80 N **
Critical Tensile Strength* (77 K)	130 MPa **	130 MPa **
Critical Tensile Strain* (77 K)	0.2% **	0.2% **
Critical Double Bend Diameter* (RT)	80 mm **	80 mm **

Specifications	Type HT-SS	Type HT-CA	Type HT-NX
Average Width	4.5 ± 0.1 mm	4.5 ± 0.1 mm	4.5 ± 0.2 mm
Average Thickness	0.29 ± 0.02 mm	0.35 ± 0.02 mm	0.31 ± 0.03 mm
Reinforced Material	Stainless Steel (20μm)	Copper Alloy (50μm)	Nickel Alloy (30μm)
Length		Up to 500m	
I_c (77 K, Self Field)		170 A, 180 A, 190 A, 200 A	
Critical Wire Tension* (RT)	230 N **	280 N **	410 N **
Critical Tensile Strength* (77 K)	270 MPa **	250 MPa **	400 MPa **
Critical Tensile Strain* (77 K)	0.4% **	0.3% **	0.5% **
Critical Double Bend Diameter* (RT)	60 mm **	60 mm **	40 mm **

Bi-2223 cables

Large magnets need cables → Limit L (→ V) and winding cost

■ Magnet cables

- Dense → High J_E
- Mechanically stable
- Transposed
- Flexible
- Scalable

■ Bi-2223 → Magnum NX[®] cable

- Solid Material Solutions
- Sumitomo HT-NX tape
 - 2 or more tapes bundled and wrapped
 - Wrapped bundles are cabled

Cabling high aspect ratio conductors is not trivial

Saraco, *Appl. Supercond. Conf.* (2020)
Otto, *Low Temp. Supercond. Workshop* (2022)
Upcoming topical review

Bi-2212 conductors

Manufactured by Bruker-OST and by Solid Material Solutions

■ Powder-in-Tube process similar to Bi-2223

- Reaction at 890 ! 1...5°C in O₂
 - → Challenge for materials
- Highest J_c with overpressure reaction

Arno Godeke – High Temperature Superconductors and Their Applications
Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

Huang, 13th EUCAS conf. (2017)

■ Novel designs

- With strengthening
 - Rectangular and round
- Cost reductions
- High J_c without overpressure

Otto, 33th ISS (2020)

Bi-2212 wires for AC applications

Rotating machines, energy, and fast ramping magnets require low AC-loss

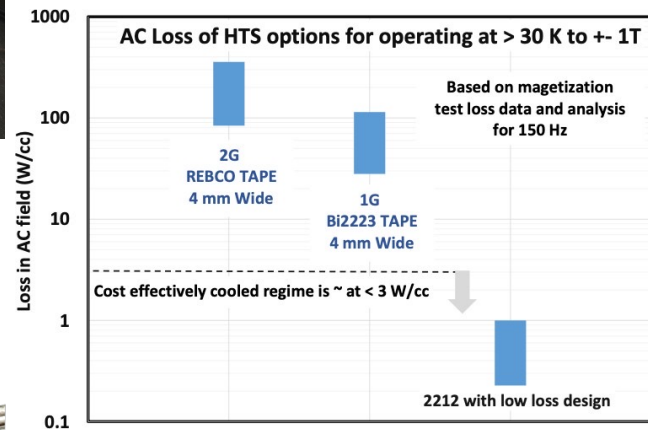

■ Reduction of AC-losses using LTS experience

- Small \varnothing filaments, \varnothing wire, and twist-pitch (loops) + resistivity

■ Comparison of losses for B_{\perp} tapes

- 2 orders of magnitude lower AC-loss

Otto, *Low Temp. Supercond. Workshop* (2022)

Low losses are key for cryogen-free: Power density gains can be cancelled by cooling needs

Bi-2212 cables

Easier to cable round and low-aspect ratio conductors

■ Traditional Rutherford cables

- For round Bi-2212 wires
 - With braided ceramic fiber insulation
- Ag is soft after reaction heat-treatment

Godeke, LBNL, unpublished (2008)

■ Cables from reinforced Bi-2212 conductors

Round reinforced cable (6 wires)

Ø 5 mm

Roll-consolidated reinforced cable

4.32 mm

2.41 mm

Reinforced large area "wire"

Reinforced transposed cable

Transposed top view

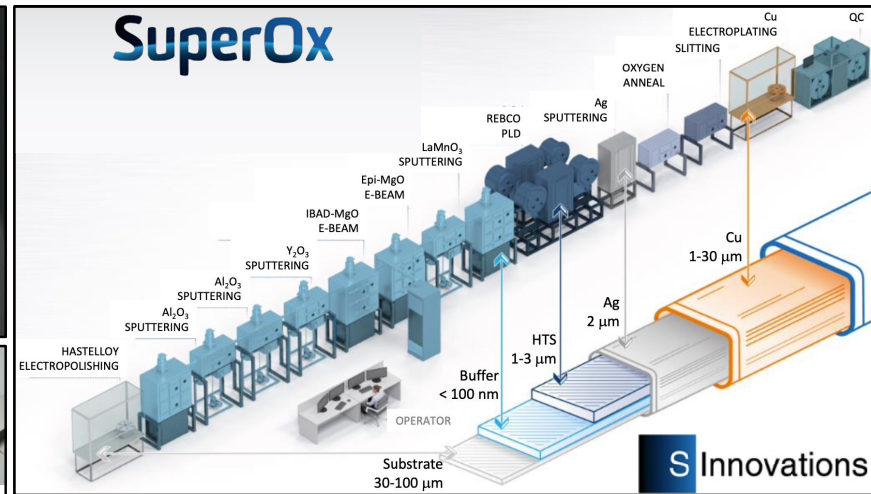

Otto, *Low Temp. Supercond. Workshop* (2022)

REBCO conductors

A non-exclusive selection...

THEVA Product flyer (2021)
 W. Prusseit, *Virtual CCA conference* (2021)
 Molodyk, *15th EUCAS* (2021)
 Lee, *Virtual CCA* (2021)
https://www.fujikura.co.jp/eng/products/newbusiness/superconductors/01/2052504_12808.html (2021)

REBCO cables

Some examples...

■ Four main configurations

- Roebel
 - KIT and IRL
 - Full transposition
- Stacks in slotted core
 - ENEA
- Cable On Round Core
 - ACT
- Twisted Stack
 - Swiss Plasma Center

Global specifications of HTS

Upcoming Topical Review

Cost of application

Performance of application

Property	Bi-2212	Bi-2223	REBCO
Physical properties			
Current manufacturers	Bruker-OST Solid Material Solutions	Sumitomo Electric Industries	> 10 companies
Superconductor Construction	$\text{Bi}_2\text{Sr}_2\text{CaCu}_2\text{O}_{8+x}$ Ag/Ag-alloy matrix Optional reinforcement	$\text{Bi}_{2-x}\text{Pb}_x\text{Sr}_2\text{Ca}_2\text{Cu}_3\text{O}_{10-y}$ Ag/Ag-alloy matrix Optional reinforcement	$[\text{RE}]\text{Ba}_2\text{Cu}_3\text{O}_{7-\delta}$ High-strength substrate Variable Cu-plating
Superconductor fraction	20–35%	30–40%	< 5%
Ag/Ag-alloy fraction	65–80%	60–70%	< 1%
Substrate fraction	—	—	50–98%
Copper fraction	—	—	0–50%
Form-factor	Twisted multi-filamentary wire	Non-twisted multi-filamentary tape	Single- or dual-layer tape
Typical dimensions	$\varnothing 0.15\text{--}1.5$ mm and squared	4.2×0.23 mm ² (bare) $4.5 \times 0.29\text{--}0.35$ mm ² (reinforced)	$2\text{--}40 \times 0.05\text{--}0.2$ mm ²
State	Wind & React or pre-reacted	Pre-reacted	Pre-reacted
Piece length [m]	> 500	> 500	< 300
Electrical properties			
$J_E(15\text{ T}, 4.2\text{ K})$ [A mm ⁻²]	200 ^a –700 ^b	350–500 ^c	400–1500 ^{e,d}
Mechanical properties			
Critical axial tensile stress [MPa]	100-130 (bare) > 250 (reinforced)	130 (bare) 250–525 (reinforced)	400–800
Usable axial strain window	0% to 0.3–0.6%	–0.1% to 0.25% (bare) –0.1% to 0.57% (1% ^e) (reinforced)	–1.2% to 0.4–0.7%
Critical transverse compressive stress [MPa]	70 (bare, impregnated) ^f	70–100 (bare) 150–250 (reinforced)	300–750

Conductor mechanics, not J_E , is the main driver for application performance

→ J_E is much less dependent on field (vs LTS), so J_E mainly determines application cost

Mechanical loads on conductors

Complex 3D loads → Tension, compression, shear, torsion, buckling,...

■ Dipole magnets

■ Solenoid magnets

■ Conductor tests

■ Reality

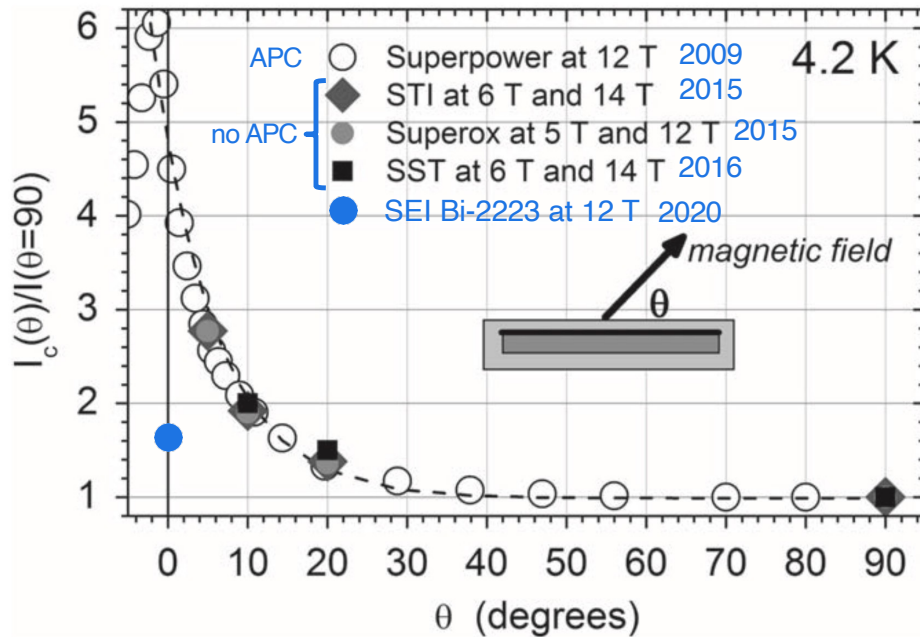

3D loads are key to successful applications. In AC applications also cyclic loads (fatigue)

Anisotropy in HTS tape conductors

Critical current depends on angle

Angular dependence of the critical current

Practical consequence

- Localized limitations of J_c

Angular dependencies are an important aspect of application design

Uglietti, *Supercond. Sci. Technol.* 32, 053001 (2019)

Arno Godeke – High Temperature Superconductors and Their Applications
 Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

Critical current of HTS

Compared to LTS

Cryogen-free designs → Driven by economics and mechanics

Key takeaways

- All HTS have sufficient J_E
- For safe operation in the indicated field-range
- Dependence on B is less than LTS
- Cryogen-free: LTS has little or no margin

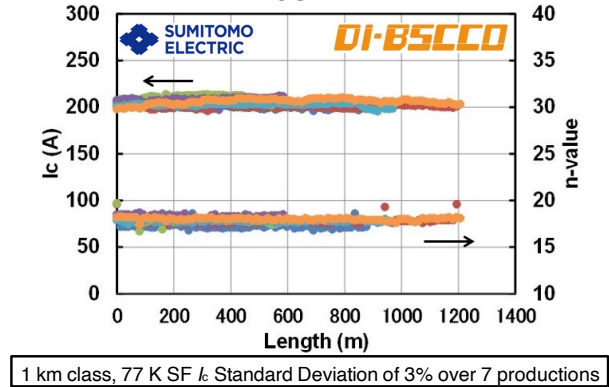

Godeke, *Supercond. Sci. Technol.* 33, 064001 (2020)

Manufacturing yield

■ Bi-2212

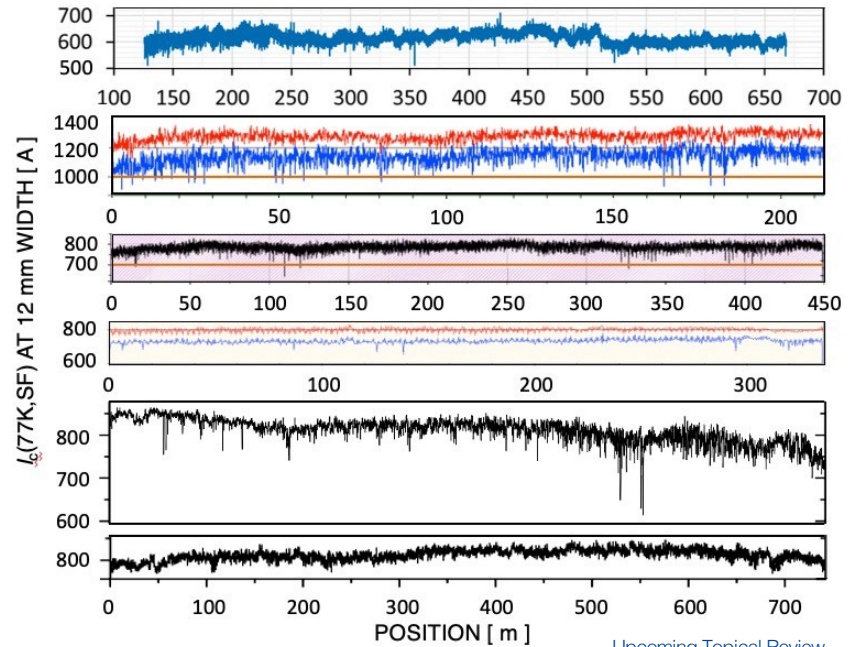

■ Bi-2223 4 mm-wide

Hayashi, 3rd Asian Supercond. Summer School (2018)

■ REBCO

Upcoming Topical Review

Bi-conductors: Traditional wire drawing
 REBCO: Harder to produce in long lengths

Generic conductor price

Compared to LTS

Indicative \$/m
 Ø0.8 mm wire
 4 mm wide tape

Nb-Ti	Nb ₃ Sn	Bi-2223	Bi-2212	REBCO
1	3.5	20	75?	40

Price ≠ cost:
 How much?
 Market potential?
 Unit lengths?
 Performance?
 Quality control?

Price per kg

Price per kAm

HTS becomes more economical at much lower field
 at increased T or when Nb₃Sn is affected by strain

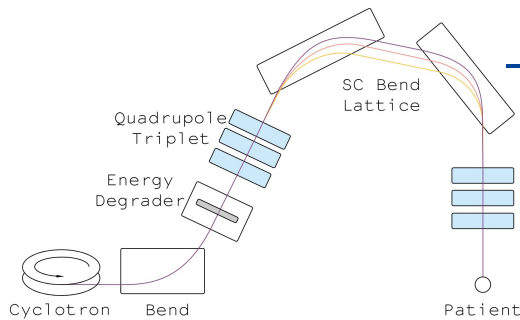

Uglietti, *Supercond. Sci. Technol.* 32, 053001 (2019)

Arno Godeke – High Temperature Superconductors and Their Applications
 Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

Thermo-economic cost case study

Cryogen-free proton therapy magnet with a 20-year lifespan

■ 4 T gantry bend magnet

■ Thermo-economic model

■ Findings

Conductor	T_{OP} [K]	Cost [k\$]
Nb-Ti	6.8	116
Nb ₃ Sn	9.4	112
Bi-2223	12.8	196
REBCO	5.7	414

■ \$ Nb-Ti > \$ Nb₃Sn (!)

- Higher cooling needs
- Low thermal margin

■ \$ Bi-2223 = \$ Nb₃Sn + 80 k\$

- But no reaction needed for HTS
- HTS is more stable: No training

■ \$ REBCO \approx 2x \$ Bi-2223

- Higher conductor capital cost

HTS is more economical for cryogen-free applications

Teyber, *Supercond. Sci. Technol.* 33, 105005 (2020)

Arno Godeke – High Temperature Superconductors and Their Applications
 Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

Agenda

■ Low Temperature Superconductors

- Why higher temperatures are cooler

■ High Temperature Superconductors

- Types, production, main properties, price

■ Applications

- Magnets, rotating machines, energy, ...

■ An outlook for HTS

Magnet applications (1)

Magnetic Resonance Imaging (MRI)

- Cryogen-free pediatric 1.5 T MRI
 - For babies and infants

- Sumitomo Bi-2223
- Actively shielded, stray field <math>< 10 \text{ m}^2</math>
- Magnet mass <math>< 2 \text{ tons}</math>

- Design for a cryogen-free 14 T whole body MRI

- Sumitomo Bi-2223 HT-NX
- Magnet → Length 1.9 m by 1.3 m OD
 - Half the size of 11.7 T LTS solution
 - Shorter than commercial 7 T LTS solution
- Compactness due to mechanical- and field-margins

Commercial medical application of HTS
Compact high-field MRI with HTS

Li, *Supercond. Sci. Techn.* 34, 125005 (2021)

Magnet applications (2)

High-field NMR

- NIMS 1.02 GHz NMR
 - LTS limit is 1 GHz (23.5 T)
 - 920 MHz LTS system as basis
 - Inner coil replaced with Sumitomo Bi-2223
 - 1.02 GHz (24 T, driven) achieved at 1.8 K

Hashi, *J. Magn. Res.* 256, 30 (2015)

- Bruker 1.2 GHz (28.2 T) NMR
 - LTS outer with REBCO insert at 2 K
 - Actively shielded
 - Commercial product
 - Persistent

Wikus, *Supercond. Sci. Technol.* 35 033001 (2022)
<https://www.bruker.com/en/products-and-solutions/mr/nmr/ascend-ghz-class.html>

1.3 GHz (30.5 T) under development (JST Mirai Program, Japan)

Magnet applications (3)

Laboratory magnets

- 5...10 T cryogen-free RT magnets
 - Sumitomo Electric Industries, Ltd.
 - Bi-2223

- 6 T cryogen-free fast ramping VSM
 - Toei Industry Co.,Ltd
 - Industrial magnetization measurements
 - +/- 6 T operating at 20 K, 70 mm RT bore
 - B-H loop in 3 minutes
 - B-H loop with LTS is 30...40 minutes

Arno Godeke – High Temperature Superconductors and Their Applications
Plenary Lecture – HTS Modelling 2022 – Nancy, France – June 15, 2022

International Thermonuclear Fusion Reactor
→ 3+ decades of international development
Reactor scales with B^4 → Compact high-B Tokamaks

Person

- Commonwealth Fusion Systems (USA)
 - REBCO
 - 20 T demonstrated in full-size coil
 - This triggered 1.8B US\$ in private funding
 - Unprecedented levels in superconductivity

Thousands of km REBCO per system + huge funding
+ potential market size if successful =
Incentives for large-scale REBCO production

<https://cfs.energy>

Rotating machines (1)

Superconducting windmills

- 3 MW-class, 14 rpm, 128 m rotor
 - THEVA REBCO racetrack coils in rotor at 30 K
 - Ground tested, installed: Thyborøn, Denmark
- Traditional windmills moved on (> 10 MW)

Successful, but high upfront development costs for follow-up

40% lower weight

PM Superconductor

Kellers, Univ. of Twente Symposium (2018)

Rotating machines (2)

Electric motors

- 3 MW ship propulsion motor (Bi-2223)
 - Kawasaki Heavy Industries

- Electric vehicles (Bi-2223)
 - Sumitomo Electric Industries

Hayashi, 3rd Asian Supercond. Summer School (2018)

- Electric planes
 - Safran / Airbus / Univ. of Lorraine

- 50 kW prototype
 - 5,000 rpm, 52 kg
 - Bi-2223 stator, REBCO bulk rotor, $T_{OP} = 30\text{ K}$

Dorget, EUCAS(2021)

Energy applications (1)

Cables

Renewable energies causing grid overflows: Trigger for cables?

FCL: Allais, Tuesday plenary

Energy applications (2)

Transformers and Fault Current Limiters

- An early HTS “transformer” demo
 - Univ. of Twente around 2000
 - With SMIT Transformers and SMIT Draad
 - 4 concentric industry-wound Bi-2223 coils
 - Vacuumschmelze + American Superconductor tape
 - Configured as a 1 MVA resonator coil
 - Ferromagnetic reduction of radial field at ends
- Significant parallel efforts, same period
 - ABB, Siemens, AMSC,...

Will climate issues trigger revisiting such transformers?

Total system designed and developed by
University of Twente, The Netherlands

Godeke, *Physica C* 372-376 1719 (2002)

An outlook for HTS

The dawn of commercial applications of HTS

- Climate
 - Private **money** → Public opinion (→ Legal → **Money**) → Governmental policy → **Funding** → **Action**
- Less fossil fuels
 - → Helium shortages → Helium **price** → **Action**
- Renewable energy
 - → Grid overloads → Incurred **costs** due to grid failures and lack of availability → **Action**
- Governmental policy changes & funding + bold investors and entrepreneurs = Action
 - Cryogen-free MRI and Compact Fusion → Today
 - Strong incentives for rotating machinery & utility industry → Tomorrow
- **Commercial applications are inevitable (after 35 years) → Driven by climate + helium shortage**
